2LITRES/MINUTE FLOW RESTRICTERS

Flow restricters are often used as part of domestic plumbing systems as water saving devices. They are normally used on bath or shower outlets to restrict to the water flow to 9 or 12litres/min.

To foster water conservation, State governments are now encouraging the installation of rainwater tanks to supply laundries and toilets. However, if a rainwater tank is used as an auxiliary source of supply, a number of water authorities are trying to discourage refilling water tanks from the mains supply.

If rainwater tanks are connected to the mains for refilling purposes, the water authorities are demanding that a 2litres/min Flow restricter is incorporated into these systems.

For many people the 2litres/min Flow restricter have proved difficult to find. However, All valve Industries has the Caleffi 534 series Flow Restricters in plentiful supply. The Caleffi 534 series Flow Restricters have a maximum pressure rating of 1200kPa and are made of chrome plated brass.

As regulations vary, ask if these are a requirement in your area if installing a rainwater tank..
